CLAIM

An electrode comprising:

an electrode base, and

- a self-assembled monolayer expressed by a chemical structural formula of ${\rm HS\,(CH_2)_{\,n}COOH}$ (n = 5 to 9) and covering said electrode base.
 - 2. An electrode as set forth in claim 1, wherein an enzyme is immobilized on said self-assembled monolayer, said enzyme making an object to be measured oxidation-reduction react.
 - A sensor comprising:

10

20

a vessel receiving a sample solution in which an object to be measured dissolves, and

a modified electrode and a counter electrode to be dipped into said sample solution,

wherein said modified electrode comprises an electrode base, and

a self-assembled monolayer expressed by a chemical structural formula of ${\rm HS}({\rm CH}_2)_n{\rm COOH}$ (n = 5 to 9) and covering said electrode base.

- 4. A sensor as set forth in claim 3, wherein a mediator is added into said sample solution, said mediator transferring a charge with said electrode base under said oxidation-reduction reaction of said object.
- 25 5. A sensor as set forth in claim 4, wherein a

hydrophobic mediator is added into said sample solution.

- 6. A sensor as set forth in any one of claims 3 to 5, wherein an enzyme is immobilized on said self-assembled monolayer, said enzyme making said object oxidation-reduction react.
- 7. A sensor as set forth in claim 3, further comprising:
- a voltage applying means for applying an electrode reaction voltage to said modified electrode, and
- a calculation means for calculating concentration of said object based on an electric current flowing between said modified electrode and said counter electrode.
- 8. A sensor as set forth in claim 7, further
 15 comprising a reference electrode,

wherein said voltage applying means applies a predetermined voltage on the basis of a voltage of said reference electrode to said modified electrode.
